- New functions are defined in *.m files
- The filename has to correspond to the function name
 - → e.g. the function myFunc is defined in myFunc.m
- New *.m files can be created using command edit in the Command Window or the menu item Home → New Script (old: File → New → M-File)
- General syntax:

```
function functionName
    . . .
end
```

- New functions are defined in *.m files
- The filename has to correspond to the function name
 - → e.g. the function myFunc is defined in myFunc.m
- New *.m files can be created using command edit in the Command Window or the menu item Home → New Script (old: File → New → M-File)
- General syntax:

```
function functionName
    . . .
end
```

```
simpleAddition.m 💥
    function simpleAddition
       input1 = [2, 3; 4, 5];
       input2 = [8, -13; 5, 9];
       input1 + input2
Command Window
  >> simpleAddition
  ans =
           -10
```

- New functions are defined in *.m files
- The filename has to correspond to the function name
 - → e.g. the function myFunc is defined in myFunc.m
- New *.m files can be created using command edit in the Command Window or the menu item Home → New Script (old: File → New → M-File)
- General syntax:

```
function functionName
    . . .
end
```

```
simpleAddition.m
     - function simpleAddition
       input1 = [2, 3; 4, 5];
       input2 = [8, -13; 5, 9];
       input1 + input2
Command Window
  >> simpleAddition
  ans =
            -10
```

- Several sub-functions can be defined in a single
 *.m file, however only the main function is visible to the outside
- Important: MATLAB will only find your *.m file if the directory is
 - set as the "Current Directory" in the main window, or
 - permanently added to the search path using

```
Home → Set Path (old: File → Set Path...)
```

```
my_first_main_function.m
       % my first main function
     function my first main function
           input1 = 23
            [s,m] = multANDsum(input1, input2);
10
11
       % this awesome function can do multiplication and summation
12
     function [summation, multiplication] = multANDsum(input1, input2)
13
           summation = input1 + input2
15
16
17
           multiplication = input1 * input2
18
           multiplication = my multiplication(input1, input2)
19
20
21
     function [output] = my multiplication(input1, input2)
           output = input1 * input2;
```

Matrix Notations

Definition of vectors/matrices

- element are contained in []
- row elements are separated by **commas** (or blanks)
- columns are separated by **semicolons**

Matrix Notations

Definition of vectors/matrices

- element are contained in []
- row elements are separated by commas (or blanks)
- columns are separated by **semicolons**
- ones(numRows, numColumns) initializes a matrix of ones
- zeros(numRows, numColumns) initializes a matrix of zeros
- eye(numRows, numColumns) returns an identity matrix
- a:b initializes a vector [a, a+1, a+2, ..., b]
- a:c:b initializes a vector [a, a+c, a+2*c, ..., b]

```
>> zeros(2,3)

ans =

0  0  0
0  0  0
```

Basic Operations

- Matrix multiplication *
- Multiplication of corresponding matrix elements .**
- Right-matrix division (solution for Ax = B)
- Element-wise division ./
- Transposition

```
>> a'
ans =

1 3
2 4
```

```
>> a = [0,1;1,0]; b = [1;2];
>> a*b

ans =

2
1

>> b*a
Error using *
Inner matrix dimensions must agree.
```

Index Expressions

- Indices start at 1 (not at 0 like in other languages)
- Index expressions can be used to reference or extract
 selected elements of a matrix or vector
- Index expressions can contain
 - scalars,
 - vectors,
 - ranges,
 - or the special operator

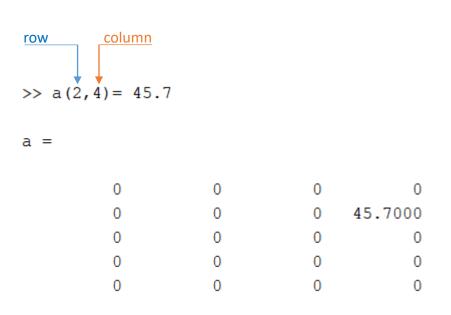

Example index expressions for matrix a

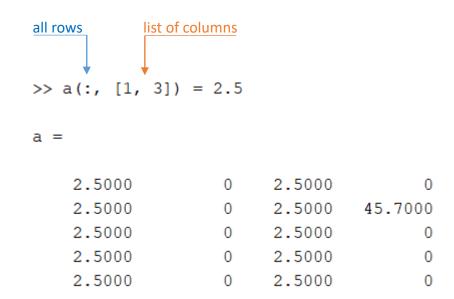

```
a(1, 2) # row 1, column 2
a(1, [1, 3]) # row 1, columns 1 and 3
a(1, 1:5) # row 1, columns in range 1-5
a(1, :) # row 1, all columns
```

Index Expressions: Examples

Relational and Logical Operators

Relational operators

< less than

> greater than

<= less than or equal

>= greater than or equal

== equal

~= not equal

Logical operators

& and

or

not

```
>> a = zeros(2)
a =
           0
>> b = ones(2)
b =
           1
>> if a~=b
t = 'different elements';
else
t = 'same elements';
end
>> t
different elements
```

Relational and Logical Operators

Relational operators < less than > greater than <= less than or equal >= greater than or equal equal

not equal

```
Logical operators

& and
| or

not
```

```
>> a = zeros(2)
a =
           0
>> b = ones(2)
b =
           1
>> if a~=b
t = 'different elements';
else
t = 'same elements';
end
>> t
different elements
```

~=

For-loop

General syntax

```
for index = values
```

... % the operations you want to repeat at every iteration

end

• Simple examples

```
for index = 1:100
    a = index * 2;
    disp(a)
end
```

```
for index = 1:2:100
    a = index * 2;
    disp(a)
end
```

```
for index = [5 27 16 43]
    a = index * 2;
    disp(a)
end
```

Vectorization

- Uses whole-array operations
- Often leads to significant speed-up compared to loop-based implementations
- Allows more compact implementations

```
for index = 1:length(a)
  if (a(index) > 5)
    a(index) -= 20
  end
end
loop-based version

vectorized version
```

Operations on Images Matrices

```
Command Window
                                     Figure 1
                                                                                         Figure 2
                                                                                   \times
>> I = imread('input.jpg');
                                                                                         File Edit Tools
>> size(I)
                                     File Edit Tools
ans =
                                                                                            Z+ Z- Insert Text Axes Grid Autoscale
                                         Z+ Z- Insert Text Axes Grid Autoscale
   600
          600
>> figure(1), imshow(I);
>> Imean = uint8(mean(I, 3));
>> figure(2), imshow(Imean);
>> size(Imean)
ans =
   600
          600
>>
                                     (464.85, 68.451)
```

Operations on Images Matrices

Help and Documentation

- doc
 open the function documentation in a separate window
- help view a text version of the function documentation in the Command Window
- lookfor search for keyword in all help entries

function_name(- display function hints by pausing after you type in the Command
 Window the open parentheses for the function input arguments
